Custom guitars, made to measure

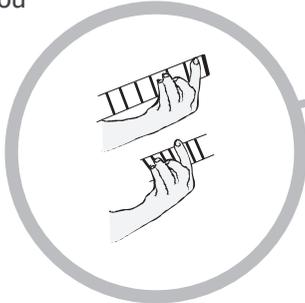

Low weight & perfect balance

By removing weight from the headstock, your guitar can be made very light and yet remain balanced.

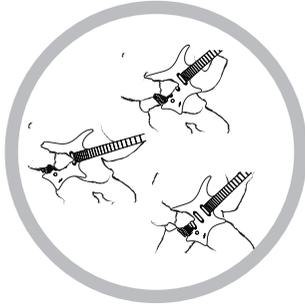

Scale lengths adapted to you

A slight fanned fret allows your wrist to remain relaxed throughout the range of play. The extra length on the bass side enhances sustain, and the shorter treble side makes bends easier.

Versatile body shape

The body shape provides multiple seated playing positions for maximum comfort and versatility, to suit any playing style.

Symbiosis between materials & design

The low weight and extreme stiffness of aircraft grade aluminium transfer the strings' vibrations more effectively into the wood of the guitar than traditional heavy materials.

All parts are tightly coupled to ensure there is no loss of energy. Fixed bridges are mounted individually in any configuration without crosstalk between strings. Tremolos are available in 6-, 7- and 8-string versions, also supporting left-handed use.

Custom hardware and color options available.
